React Native and Expo engineer with 3.5 years of production experience across mobile and web. Since June 2025 I have been the primary React Native developer at a US fantasy sports startup, owning the mobile app end to end, including a realtime snake draft, wallet flows and API integration, and contributing backend features in Go and Django. Before that I delivered the frontend for a K-12 school platform across three mobile apps and a multi-tenant React dashboard.

Core Competencies

- **React Native and Expo**: iOS and Android delivery end to end, covering navigation architecture, push notifications, deep links, in-app payments, OTA updates, crash monitoring, and store releases.
- **Realtime systems**: WebSocket and Ably state synchronization, turn-based state machines, recovery on lossy mobile networks, and optimistic updates the server can correct.
- **React, TypeScript and Next.js**: dashboard-heavy product surfaces, permission-driven routing, lazy-loaded code splitting, and reusable component systems.
- **Backend contribution**: features in a Go realtime service backed by Redis and in Django REST APIs, plus session and token auth with Clerk and Ably.
- **Frontend architecture**: centralized auth with token refresh, shared API layers with retry and error boundaries, and cross-app infrastructure built once and reused.

Professional Experience

- **Shotgun Fantasy Sports** — **Remote (US startup)**
  React Native Engineer — *Jun 2025–Present*

  Daily fantasy sports app, in active development. Primary React Native developer; I own the Expo app end to end and contribute to the backend.
  - Built the realtime snake draft: turn resolution, roster-slot assignment and auto-pick in the app, with versioned room state written atomically to Redis in the Go draft service.
  - Made draft state recover cleanly on lossy mobile networks, so reconnecting players rejoin at the correct turn.
  - Delivered private contests end to end: invite deep links in the app, plus contest preparation, settlement and refunds on the server.
  - Added Clerk session verification on draft routes and Ably token auth for mobile realtime.
  - Built wallet and checkout flows that only show balances the backend has confirmed, with contest join cutoffs re-checked right before charging.
  - Built the contest lobby, 4/8/16-player elimination brackets, and lineup editing under positional constraints.

- **Goreeva** **Ohio, US (Remote)**
  Frontend Engineer *May 2023–May 2025*
  K-12 school management platform. Delivered the frontend end to end; occasional fixes and small features since.
  - Owned and delivered the frontend across three mobile apps and a web dashboard, from architecture through App Store and Play Store releases.
  - Designed a multi-tenant, role-based dashboard for admins, teachers, and students from a single codebase, with navigation driven by 20+ granular permission keys and lazy-loaded splitting across 80+ views.
  - Engineered a printable report card system handling dynamic grading schemes, co-scholastic assessments, and bulk student editing, replacing a manual paper workflow.
  - Built a parent app with on-device speech recognition and a state-machine chatflow, letting non-English-speaking parents navigate by voice in Hindi and Marathi.
  - Established shared infrastructure reused across every app: centralized auth with token refresh, a shared API layer with retry and error boundaries, crash monitoring, push notifications, and a component library.
  - Shipped payment collection, library management with barcode scanning, CSV bulk-import onboarding, and teacher speed-grading workflows.
  - Live on Google Play and the App Store.

Technical Skills

- **Core**: React Native, Expo, React, TypeScript, JavaScript, Next.js, HTML, CSS
- **State and realtime**: Zustand, Redux, WebSockets, Ably, custom state machines, server-state caching
- **Backend and data**: Go, Django, Node.js, Postgres, Redis, Prisma, REST APIs, Clerk, JWT auth
- **Operations**: Sentry, Firebase, EAS, GitHub Actions, Vercel, Docker
- **Also**: Swift and SwiftUI for personal macOS tools; agentic development with Claude Code

Selected Personal Projects

- **Caretalk**: health memory you talk to. Plain-language updates become dated facts, with an MCP server so Claude can read and write them. TypeScript, MCP, Postgres.
- **Decio**: people-first city network with profiles, connections, city posts and direct chat. Expo, Go, Postgres, Ably.
- **Tattwix**: polyglot monorepo where a React web app, an Expo app and a Django API share typed contracts and validated env config.
- **LinkWheel**: macOS default browser that opens a radial menu at the cursor so every link lands in the right browser profile. Swift, AppKit.

Education

- **Thapar Institute of Engineering and Technology** **Patiala, India**
  B.E. Computer Science *2019–2023*
  GPA 7.21
